

Add the two equations together.

$$\begin{aligned} 4. \quad & 3x + 2y = -1 \\ 5. \quad & -8x - 2y = -4 \\ & -5x = -5 \\ & x = 1 \end{aligned}$$

Now substitute  $x = 1$  back into either equation 4. Or 5.

$$3(1) + 2y = -1$$

$$3 + 2y = -1$$

$$2y = -4$$

$$y = -2$$

Now substitute back into one of the original equations both  $x = 1$  and  $y = -2$  to solve for  $z$ .

$$\begin{aligned} 1. \quad & X + y - z = -4 \\ & (1) + (-2) - z = -4 \\ & -1 - z = -4 \\ & -z = -3 \\ & z = 3 \end{aligned}$$

Check this order triplet into the other two equations

$$\begin{aligned} 2. \quad & 2x + y + z = 3 \\ & 2(1) + (-2) + (3) = 3 \end{aligned}$$

$$\begin{aligned} 3. \quad & X - 2y + 3z = 14 \\ & (1) - 2(-2) + 3(3) = 14 \end{aligned}$$

Therefore,  $(1, -2, 3)$  is the solution to the system of equations.
